

Tutorial 5– Decision Making and Branching

1. Run the following code. Explain the output.

```
int main ()
{
    int i = 1, j = 2, k = 3;
    if (i > j)
        if (i > k)
            cout << "A";
        else
            cout << "B";
    return 0;
}
```

2. Write a C++ program using **if statements** to accept two integers and check whether they are equal or not and if not equal display the greater number.
3. Write a C++ program using **if statement** to display the smallest integer among three integers given as input (*using logical operators*).
4. Write a C++ program to check whether an alphabet given as input is vowel or, consonant (*use logical operators*).
5. Write a C++ program to display the number of days in a month using **switch case** where the month number is given as input.

Sample out puts:

*Enter the number of a month (January is 1) to
find out the number days in the month: 5
May, 31 days*

6. Write a C++ program to create a simple calculator having Addition, Subtraction, Division and Multiplication operations with two input values using **switch case**.

Sample out puts:

Enter an operator +,-,/,*
+
Enter two numbers to add
2.4
3.5
Answer is 5.9

Enter an operator +,-,/,*
/
Enter two numbers to divide
6
4
Answer is 1.5

Enter an operator +,-,/,*
6
Error! enter an operator +, -, / or *
