

Tutorial 8-Functions

1. Write a C++ program using user defined functions to enter a positive number greater than 10 and display all the integers from 10 till the number given as input. All the values should be displayed separated by comma.
2. Write a C++ program using user defined functions to print the multiplication table of any number (given as input) up to 12 using **for** loop and print the result in the following format.

Multiplication Table
=====

1	x	number	=	result
---	---	--------	---	--------

3. Write a C++ program using user defined functions to give the input of radius of a circle (decimal value). Calculate and display the area of the circle.
4. Write a C++ program using user defined functions to enter a value from the keyboard. Use conditional operator to design this program. Check whether the input value is positive or not and add 5 to the input value if it is positive, otherwise subtract 5 from the input value and display the final output.
5. Write a C++ program using user defined functions to print the list of even numbers and odd numbers from 1 to 50. Call the even function and the odd function from the main() function. Print the list of even numbers in the even function and print the list of odd numbers in the odd function.
