

Tutorial 11 – Character sequences and Structure

1. Compare two strings entered as a character array and use switch case to display the result for different cases (*same size, first string is longer than the second or, second string greater than the first string*).
2. Using `strlen( )` function check display the size of the above strings in Q1.
3. Using `strcpy( )` function copy first string to second used in Q1.
4. Write a C++ program to accept your first name and second name as separate strings. Concatenate them and display the result as a single statement with required spaces added in the middle.
5. Create a structure called rectangle having fields length and breadth. Instruct the user to enter the length and breadth of TWO different rectangles. Calculate the area of each rectangles and display the area defining which rectangle has greatest area.
6. Create a structure for a book entry in a library.

Book Title (string of 20 characters)

Book ID (integer)

Author (string of 20 characters)

Edition (string of 5 characters)

Pages (integer)

Price (float)

Create a struct named Book and allow user to input 3 book details at a time. And display the entered data.
