

## Tutorial 2 – Basic input/output

1. Write a C++ program where you will be asked to enter the last three numbers of your Student ID as input and then the output should be as mentioned below:

My STUDENT ID's last three numbers are: 123

2. Write a program in C++ to divide two numbers and print them on the screen.  
Sample Output: (hint: 3 is a calculated value)

**Divide two numbers and print:**

-----

**The quotient of 30 and 10 is : 3**

3. Write a C++ program to find and print the Area and Perimeter of a Rectangle. Ask the user to enter length and width of the rectangle and calculate using the formula given below.

area = length \* width

perimeter = 2(l+w)

4. Write a C++ program to convert the temperature in Fahrenheit to Celsius. Ask the user to enter a temperature in Fahrenheit and convert it using the following formula

$C = ((F-32)/9)*5$  where C is temperature in Celsius and F is temperature in Fahrenheit.

5. Write a C++ program to capture current year and year of birth and calculate the age of the person.

Sample output:

Enter current year: 2025

Enter the year you were born in: 2002

You will be 23 this year.
